

Smart Antenna Selector

The best solution for TV domes switching

The Smarter way to select your Antenna

- The Smart Antenna Selector allows to select the TV antenna according with the customer needs
- Two array of satellite decoders can receive the signal from each antenna (Direct Mode) or the best signal chosen from the two antennas
- Based on Crestron series 3 processor, the system reads signal level, azimuth position and tracking status from the antenna BDE
- Manual and automatic modes are selectable from front panel and/or intuitive GUI
- Compatible with KHV HD11, TV8, TV6 and TV5 antennas
- Available soon for Seatel TV series

Smart and Direct modes

- **Smart mode** routes the best signal to both satellite receivers distributions, automatically or manually. The antennas must track the same satellite.
- **Direct mode** routes both antennas signals to both satellite receivers distributions (A → A, B → B) having two different satellites available at the same time.

Front and Rear view

Graphic User Interface

Windows PC

Without installing anything the system status could be viewed and managed with an intuitive interface, just by a click on the executable file provided with the system. The interface works with Windows 7,8 and 10.

Apple iPad

Downloading the Crestron Mobile app, you can access the user interface and manage it from your Ipad
